

Kirill Degtyarev

Senior QA automation engineer (Java SDET)

Phone: +48 572 438 431

Address: Poland, Gdansk

Website: <https://www.linkedin.com/in/kirill-degtyarev-655423116>

Email: sensesnet@gmail.com

I have over than 10 years of experience as Software Developer in Test. I skilled in different types of testing such as functional testing, WEB app testing, mobile app testing, GUI app testing, system regression, performance testing.

I used a lot of solutions from testing world, all of that I realized at own tests frameworks. My goal, it helps to save time for acceptance or full regression test runs, have result in a few hours and speed up the development process. I practiced of using continuous integration system (pipeline, nightly runs, triggers).

I'm active person, looking some powerful and new (courses, technologies (like Spring Framework, Salesforce), hardware).

I'm sociable, so I have many friends in IT sphere.

Some my work you can look on: <https://github.com/sensesnet>

EXPERTISE

Stack: Java, Spring Cloud, Spring Boot, Scala

Types: Functional testing, Automated testing, Performance testing; API testing

AQA UI: Page-object; Page-factory; et al.

Building: SBT; Maven, Apache Ant, Gradle.

Data: JDBC, Hibernate; (**DB:** MySQL; DB2; Postgres).

BDD: Cucumber (Gerkin), Gauge.

Base JUnit; TestNg;

Functional testing frameworks Sikuli; Selenium; Selenide; Winium; ScalaTest.

Performance testing: Jmeter(+ inside test framework with report system); Scala + Akka.

Server: Apache Tomcat; WebSphere; Nginx.

IDE and tools: IntelliJ IDEA, Eclipse, Git.

Reporting: Alure; NET.Masterthought, ScalaReport.

Continuous integration: JetBrains Teamcity; Jenkins; Atlassian Bamboo.

VCS: Git (Bitbucket, GitLab, GitHub).

Operating systems: Mac, Linux Ubuntu.

Doc: Confluence, aDoc.

Mobile app (Native): Appium (Android/IOS app).

Mobile emulator: Genymotion

Deploy app: Docker & K8s

EXPERIENCE & PROJECTS

Epam (Gdansk, Poland)

June 2021 to Present

Senior Software Developer | SDET

Project: *Microservices (gaming)*

- Increase automation testing coverage
- Refactor existing code to make it more scalable and maintainable.
- Bring new approaches to existing solutions by using modern best practices and new frameworks.
- Keep current documentation in a consistent state.
- Write integration, functional, contract and unit tests for new services.
- Extend the multiplatform and multilayer framework for automation testing
- Integrate the framework and tools into the company development lifecycle
- Iteratively improve the outcome of automation testing for business
- Continuously learn new tools, approaches and frameworks
- Resolve technical issues

Skills:

- Strong coding skills (Java, Spring Cloud, Spring Boot)
- End-to-End testing on UI and API levels
- CI (Teamcity, Jenkins)
- Microservices architecture
- System, result-oriented mindset
- Consumer Driven Contract testing
- Docker, Kubernetes
- Testing web and mobile games
- Processes follow Agile methodologies

Team: 1 Project Coordinator, 1 SDET, 2 Java developers

Evolution Gaming (Minsk, Belarus)

Nov 2020 to June 2021

Senior Scala QA automation engineer

Project: Backoffice platform

My activities related to main game reporting system inside Backoffice platform.

The testing process included:

- functional test framework creation for UI browser testing (e2e tests)
- test implementation (BDD) and preparing test data (JSON)
- the process of configuring local test run on Docker
- the process of running test inside Jenkins pipeline CI/CD, configuration process (manifest; MR)
- test result (standard Scala report system) **Agile:** Kanban.

QA Team: 1 Project Coordinator, 1 Automation QA, 2 – manual QA

BE Team: 3 developers

FE Team: 3 developers

Stack: Scala; Cats; ScalaTest; Selenium; BDD; docker; CI/CD(k8s; Jenkins); JDBC. **Testing:** e2e tests & integration tests

EXPERIENCE & PROJECTS

iFUTURE (Minsk, Belarus)

Nov 2019 to 2020

JAVA BE Developer | QA automation mentor

Project: OROPAY – money transfer system (about: <https://www.oropay.com/>).

The payment system is any system used to settle financial transactions through the payments transfer, and includes the institutions, instruments, people, rules, procedures, standards, and technologies that make such an exchange possible. Developing functionality on backend side, work with service-oriented architecture. Analysis new features.

Agile: 2 weeks sprint.

QA Team: 1 Project Coordinator, 2 Automated QA, 3 QA

Stack: Java 8; Spring Boot; Web Services (REST); JDBC template.

Testing: unit & integration tests

iFUTURE (Minsk, Belarus)

July 2018 to Nov 2019

Lead/Senior QA automation engineer

I realized BDD acceptance and full regression testing, test cases coverage was created with QA and BI teams. During the project, I connected with dev. team and used all possibilities for testing such as (API (Swagger), SCH, SFTP, IMAP, DB, Logs).

It helped me to create preconditions for test and create independent test from each other. I realized multithreading runs (used JUnit runners + Maven profiles) and integrated project at Bamboo.

I used only high level test cases for BDD descriptions and it helped to have very readable and useful report. I added to report browsers screenshot after each of error. I had own building server for testing used Docker + Nginx. The main idea was created UI tests for three WEB payment clients.

Agile: 2 weeks sprint.

QA Team: 1 Project Coordinator, 1 Automated QA, 3 QA

Stack: Java SE v.10; (Selenium WebDriver; API; JDBC; JSCH; SFTP; IMAP; Maven).

Pattern: Page-object; et al.

Data: JDBC, Postgres.

Test FW: JUnit + CUCUMBER.

File transfer protocols: SFTP, JSCH, IMAP.

Test server: Docker + Nginx. **CI:**

Bamboo.

Godel Technologies (Minsk, Belarus)

June 2017 to July 2018

QA automation engineer

Project: Earthport – money transfer system (about: <https://www.earthport.com/about-us/>).

The project was connected with payments to almost any bank account in the world, delivering significant cost and operational efficiencies. I realized BDD acceptance testing, test cases coverage was created by QA team.

We tried using 'Shift Left Testing model' for test creation and this conception gave results. Sometimes I started to create test coverage before than feature was created by developers.

During the project, I connected with dev. team and used all possibilities for testing such as (API, SCH, SFTP, DB, Logs).

The main idea was created acceptance UI tests for WEB payment clients.

Agile: 2 week sprint.

QA Team: 1 Project Coordinator, 3 Automated QA, 6 QA

Stack: Java SE v.8; (Selenium WebDriver; API; JDBC; JSCH; SFTP; IMAP; Maven).

Pattern: Page-object; et al.

Data: JDBC, DB2.

Test: JUnit + CUCUMBER.

EXPERIENCE & PROJECTS

ALFA-BANK (IBA) (Minsk, Belarus)

February 2016 to June 2017

QA automation engineer

Projects: Alfa-click(WEB); Cashbox(GUI); InSync(native)
about (<https://www.alfabank.by/>).

Alfa-click (WEB Client-Bank)

The system "Client-Bank" allows creating a flexible and mobile interaction system between customer and the bank via organization of integrated electronic service.

The main idea of tests project was created full regression control and describe full process flow for newcomers. We tried to use BDD testing because it helped to describe all process flow and connected with UI tests. Only high-level steps were used for tests coverage. During the tests project we created tests model, described all process flow and realized project. Interesting moments for me was using Page Factory as a main test framework and Java Reflection for locator implementing.

Stack: JavaSE; JDBC (MySQL); Selenium WebDriver;
JUnit + Cucumber API; Java Reflection API; Regular expressions (main pattern PageFactory). **QA**
Team: 1 Project Coordinator, 1 Automated QA, 3 QA

Cashbox (GUI app)

The Cashbox is a relatively simple application for Windows that manages finances. It allows the bank cashier to manage multiple accounts with many convenient features. Cashbox is currently under active development and many features will be added in the future.

Application was created on java 6 with Swing API. It looked like a challenge by next reason:

- Products Company did not provide the source code;
- I had empty window when tried to find locators, all object at app.window was invisible for 'Autolt' and other app.

Stack: JavaSE, Winium, Sikuli, Regular Expression, Cucumber, JUnit (main pattern Page Objects).
QA Team: 1 Project Coordinator, 1 Automated QA, 3 QA

InSync (native app.)

InSync is - reliable, technological and convenient mobile banking.

I decided to use 'Appium' automation framework for use with native. Only android native was covered and tested during the project. I covered performance tests by JMeter.

The project included test coverage for main fifteenth operations.

Stack: Java SE; (Selenium WebDriver; JDBC; Java Reflection, Maven, TestNg; + CUCUMBER).
Performance: Jmeter
Emulator: Genymoution
QA Team: 1 Project Coordinator, 1 Automated QA, 3 QA

EDUCATION & COURSES

Belarusian State University of Informatics and Radioelectronics *2005 to 2010* bachelor's degree

Study Faculty is 'Information Technology and Management in technical systems'. Activities and Societies:

<http://www.bsuir.by/en/about-bsuir>

Participate in 25 scientific conferences . Have three scientific innovations in electronics.

Belarusian State University of Informatics and Radioelectronics

2010 to 2011

master's *degree* course "Automation of engineering systems"

Automation engineer

Activities and Societies: <http://www.bsuir.by/en/master-degree> Create project about automation process from gas storage park.

IBA Minsk (Java courses)

practice

2013 to 2014

(OOP; Identifiers; Expressions and Flow Control; Class Design; Exceptions&Assertions; Collections and Generics Framework;I/O; Swing API; Threads; Networking; ANT; Pattern)

IT Academy (Java EE courses) practice

2015 to 2016

Activities and Societies: <https://github.com/sensesnet>

JSP + JDBC (MVC - architecture, Maven, Tomcat, Git)

JSP + Hibernate (MVC - architecture, Maven, mapping, annotation, HQL, transaction)

Spring+Hibernate(MVC - architecture, Maven, Beans, SpEl, Spring MVC, Spring Security, REST)

IBA Minsk (Java courses)

practice

2016 to 2017

- Selenium WebDriver (locators, waits);

- Data-Driven testing;

- Behavior Driven Development

(Cucumber JVM + Selenium Webdriver, JBehave + Selenium Web driver;

- Page Object/ Page factory;

- PhantomJS and SlimerJS;

- Selenium GRID

IT Academy (JS courses)

practice

2018 to 2019

HTML CSS; JavaScript; JQuery

(DOM, SVG, Render tree, MVC, AJAX, SPA).

IT Academy (JD2 courses)

Java 8; (JDBC; JSP; Servlets)

(Hibernate; Spring 5; Rest; Spring AOP)

*2019
